FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Executive Summary

Between 6 and 12 January 2026, Russian and Ukrainian forces continued active contestation of territory across multiple operational axes, with the overall balance of territorial change remaining decisively in Russia's favor. During the reporting period, Russian forces achieved net territorial gains of approximately 43.7 km², while Ukrainian forces registered limited counter-gains totaling approximately 1.0 km². The intensity of activity and scale of movement confirm Donetsk Oblast as the primary theater of operations, supplemented by localized advances in Zaporizhia and Sumy Oblasts. Ukrainian activity remained spatially and quantitatively constrained, with marginal gains primarily observed in Dnipropetrovsk Oblast.

Russian advances were concentrated early in the reporting window, peaking on 7 January, whereas Ukrainian gains peaked on 9 January and did not translate into sustained territorial recovery. The three largest Russian advances accounted for over half of total weekly gains, reflecting a pattern of focused, incremental expansion rather than broad-front maneuver. Several Russian advances brought frontline positions into immediate proximity of additional settlements, indicating near-term risk of further localized territorial erosion, particularly in Donetsk Oblast.

At the settlement level, Russian forces expanded control in ten settlements during the period, including newly occupied localities in Donetsk Oblast such as Shakhove, Novomarkove, and Fedorivka. Ukrainian forces expanded control in one settlement only. Multiple settlements experienced repeated contact, underscoring continued tactical fluidity despite the overall strategic asymmetry in territorial change. Terrain analysis indicates that recent Russian gains predominantly affected farmland, but also included forested and residential areas, highlighting continued pressure on populated and economically relevant zones.

From a materiel perspective, Russian equipment losses remained below the long-term weekly average, with 16 losses reported by WarSpotting and 89 confirmed losses by Oryx during the period. Losses were concentrated in infantry fighting vehicles and general-purpose vehicles, suggesting sustained mechanized and infantry-centric operations rather than high-intensity armored breakthroughs. Ukrainian losses reported by Oryx slightly exceeded Russian losses for the week, maintaining a Russian-to-Ukrainian cumulative loss ratio of approximately 2.16. Unit-level attribution indicates notable Russian losses within the 123rd Separate Guards Motor Rifle Brigade, with Volnovakha Raion emerging as a focal area of sustained combat activity.

As of 12 January 2026, Russian forces occupy approximately 96,527 km² of Ukrainian territory, equivalent to 16.1% of the country. Weekly growth in occupied territory remained modest in percentage terms but persistent in absolute terms. Donetsk Oblast remains the most operationally significant partially occupied region, now nearly 78% occupied, with current trends indicating continued gradual expansion rather than rapid operational collapse. Zaporizhia Oblast showed limited but steady Russian progress, while Kharkiv Oblast remained largely static.

Overall, the reporting period indicates a continuation of Russia's strategy of incremental territorial expansion supported by sustained ground pressure, while Ukrainian forces demonstrated localized tactical resilience without achieving operationally significant territorial reversal. The current trajectory suggests a protracted contest characterized by gradual Russian advances, limited Ukrainian counter-gains, and enduring high operational tempo in key eastern and southeastern oblasts.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Operational Overview

According to DeepStateMap reporting, between 7 and 12 January 2026, Russian and Ukrainian forces remained engaged in active ground combat across multiple operational axes. During the seven-day reporting period, Russian forces achieved net territorial gains of approximately 43.7 km², while Ukrainian forces secured limited gains totaling approximately 1.0 km². Russian advances were primarily concentrated in Donetsk Oblast (33.1 km²), with secondary gains recorded in Zaporizhia Oblast (6.6 km²) and Sumy Oblast (2.3 km²). Ukrainian territorial gains were marginal and localized, with the most notable activity recorded in Dnipropetrovsk Oblast (0.9 km²), followed by minor adjustments in Donetsk Oblast (0.1 km²) and no confirmed net change in Kharkiv Oblast. Overall, Donetsk, Zaporizhia, and Sumy Oblasts constituted the most kinetically active areas during the reporting period. The highest tempo of Russian territorial expansion occurred on 7 January 2026, while Ukrainian gains peaked on 9 January 2026.

Distribution of Gains by Oblast (Last 7 Days)

Between 5 and 12 January 2026, Russian forces recorded cumulative territorial gains of approximately 43.7 km². The three largest advances accounted for roughly 23.0 km², representing 53% of total weekly gains, indicating a pattern of concentrated, sector-specific progress. The largest single advance covered approximately 8.7 km² (around 20% of weekly gains) and, while not yet affecting any settlements, brought Russian forward elements into close proximity to Katerynivka and Kleban-Byk, which may become contested should the advance continue. The second-largest advance, totaling approximately 7.8 km² (18% of weekly gains), resulted in the expansion of Russian control within the settlement of Shakhove, with no immediate spillover anticipated. The third-largest advance, covering approximately 6.5 km² (15% of weekly gains), affected the settlement of Novomarkove and placed the nearby settlement of Maiske at increased risk of contact in the near term.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

During the same period, Ukrainian forces achieved cumulative territorial gains of approximately 1.0 km². These gains were highly concentrated, with the largest single advance accounting for approximately 0.94 km², or roughly 90% of total Ukrainian gains for the week. This advance did not affect any settlements and is assessed as a localized tactical adjustment rather than a sustained counteroffensive. A second, smaller gain of approximately 0.11 km² accounted for the remaining 10% of weekly Ukrainian gains and similarly did not impact any settlements. Overall, Ukrainian territorial activity during the reporting period remained limited in scale and effect when compared to Russian advances.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

According to DeepStateMap reporting, during the period from 6 to 12 January 2026, Russian forces continued to expand their territorial control, albeit at a reduced tempo compared to the previous reporting cycle. Over this period, Russian forces secured approximately 99.8 km² of additional territory, representing a decrease of 41.9% relative to the previous week's gains of 171.8 km². Ukrainian forces recorded limited territorial recovery totaling approximately 0.5 km², marking a nominal increase compared to the previous week, during which no net gains were confirmed.

Donetsk Oblast remained the most heavily affected region, with Russian forces consolidating and expanding control in and around the settlements of Shakhove, Novomarkove, and Fedorivka. Newly occupied localities during the reporting period include the villages of Novomarkove, Fedorivka, and Shakhove, all located within Donetsk Oblast, indicating continued Russian emphasis on incremental settlement-level advances in this sector.

Based on observed rates of advance, with a median weekly progression of approximately 0.69 km and a dynamic buffer of 686 meters, several additional settlements are assessed to be at near-term risk of contact or partial occupation should current trends persist. These include Kleban-Byk in Donetsk Oblast (approximately 36 meters from the current line of contact), Andriivka in Sumy Oblast (approximately 133 meters), and Fedorivka in Donetsk Oblast (approximately 278 meters). This pattern suggests continued localized pressure rather than a broad operational breakthrough in the immediate term.

This assessment examines the occupation status of Ukraine at the national level and concentrates on oblasts where Russian occupation ranges between **2% and 95%**, thereby excluding regions with either negligible Russian presence or near-total occupation, where short-term changes are operationally insignificant.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

As of the latest reporting period, Russian forces occupy approximately **16.1% of Ukraine's total territory**. At the current observed weekly rate of territorial change, a hypothetical full occupation of Ukraine would require approximately **11,839 weeks**, or **around 228 years**, underscoring the limited strategic scalability of current Russian territorial gains at the national level.

Within partially occupied oblasts, **Donetsk Oblast** remains the principal area of operational significance. Russian forces currently control approximately **77.9%** of the oblast. Over the past week, the occupied area increased by **33.0 km²**, equivalent to a **0.12%** change. If this rate were sustained, full occupation of Donetsk Oblast could theoretically occur within approximately **179 weeks** (around **3.4 years**), highlighting the oblast as the most time-compressed and operationally decisive theater.

In **Zaporizhia Oblast**, Russian forces control approximately **74.8%** of the territory. Weekly expansion amounted to **6.6 km² (0.02%)**, indicating a substantially slower tempo. Continuation of this trend would suggest a timeline of approximately **1,032 weeks** (nearly **20 years**) to achieve full occupation, reflecting a more static and contested operational environment.

Kharkiv Oblast remains only marginally occupied, with Russian forces controlling approximately **4.7%** of the territory. Weekly change was limited to **1.6 km² (0.01%)**, and at the current rate, full occupation would require in excess of **18,000 weeks** (over **350 years**), indicating that Russian advances in this sector are operationally constrained and strategically non-decisive under present conditions.

Daily Situation Overview Summary

Executive Summary

This assessment draws on daily frontline geometries published by the DeepStateMap project and spatially enriched with OpenStreetMap datasets, including land use classification, transportation infrastructure, hydrology, and settlement boundaries. Territorial control changes were derived through geometric differencing of consecutive frontline polygons. The reporting period covers **06–12 January 2026**.

During the reporting window, confirmed territorial changes were observed in **Donetsk, Kharkiv, and Zaporizhia Oblasts**. No verified territorial changes were detected in other regions.

By the end of the observation period, **Russian forces retained control of approximately 43.67 km² of territory gained** during the reporting window, while **Ukrainian forces retained approximately 1.04 km² of territory recovered** from Russian control. These figures reflect net territorial control at period end and account for areas that changed hands multiple times.

Terrain analysis indicates that areas under newly established Russian control consisted predominantly of **agricultural land (17.29 km²; 73.8%)**, followed by **forest (2.99 km²; 12.8%)** and **residential areas (2.44 km²; 10.4%)**, with smaller proportions of industrial and commercial zones. This distribution indicates continued combat activity affecting both populated areas and economically relevant terrain.

At the settlement level, Russian forces expanded control in **10 settlements**, while Ukrainian forces expanded control in **one settlement**. Several localities experienced repeated contact, with control shifting multiple times during the reporting period.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Daily Situation Overview

06 January 2026

No confirmed territorial gains were recorded by either Russian or Ukrainian forces.

07 January 2026

Russian Forces

- **Donetsk Oblast:** Approx. **1.32 km²** gained across three settlements.
- Terrain composition: farmland (53.6%), residential (42.4%), forest (3.6%), cemetery (<1%).

Affected settlements:

- **Novomarkove:** Control expanded to 0.37 km² (49.8% of settlement area); initial contact recorded on this date.
- **Fedorivka (village, pop. ~64):** Control expanded to 0.61 km² (78.7%); initial contact on this date.
- **Fedorivka (settlement, pop. ~410):** Control expanded to 1.36 km² (87.0%); initial contact on this date.

Ukrainian Forces

- No confirmed territorial gains.

08 January 2026

Russian Forces

- **Donetsk Oblast:** Approx. **0.40 km²** gained across three settlements.
- Terrain composition: residential (97.2%), farmland (1.9%), cemetery (0.8%).

Affected settlements:

- **Novomarkove:** Control expanded to 0.72 km² (98.5% of settlement area).
- **Maiske:** Initial contact; control expanded to 0.04 km² (7.5%).
- **Chasiv Yar:** Contact recorded; no net territorial change on this date.

Ukrainian Forces

- No confirmed territorial gains.

09 January 2026

Russian Forces

- **Zaporizhia Oblast:** Approx. **3.20 km²** gained across two settlements.
- Advance assessed as aligned with the **R-85 highway axis** and included a crossing of the **Haichul River**.
- Terrain composition: residential (86.9%), allotments (13.1%).

Affected settlements:

- **Prymorske:** Control expanded to 0.80 km² (6.7%).
- **Huliaipole:** Control expanded to 6.50 km² (25.3%).

Ukrainian Forces

- No confirmed territorial gains.

10 January 2026

No confirmed territorial gains were recorded by either side.

11 January 2026

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Russian Forces

- **Donetsk Oblast:** Approx. **0.44 km²** gained affecting one settlement.
- Terrain composition: residential (54.1%), farmland (29.5%), forest (13.2%), industrial (3.2%).

Affected settlement:

- **Kleban-Byk:** Initial contact recorded; control expanded to 0.45 km² (71.6%).

Ukrainian Forces

- No confirmed territorial gains.

12 January 2026

Russian Forces

- **Donetsk Oblast:** Approx. **1.15 km²** gained across two settlements.
 - Advance aligned with the **H-32 highway** and included a crossing of the **Kazennyi Torets River**.
 - Terrain composition: industrial (53.1%), forest (28.7%), farmyard (14.4%).

Affected settlements:

- **Shakhove:** Control expanded to 1.12 km² (35.5%).
- **Pokrovsk:** Control expanded to 23.02 km² (73.9%).
- **Kharkiv Oblast:** Approx. **1.01 km²** gained.
 - Terrain composition: residential (>99%).

Affected settlement:

- **Vovchansk:** Control expanded to 11.31 km² (52.4%).

Ukrainian Forces

- **Donetsk Oblast:** Approx. **0.11 km²** regained.
 - Terrain composition: forest (43.7%), allotments (41.0%), residential (15.3%).

Affected settlement:

- **Pokrovsk:** Ukrainian control expanded to 22.74 km² (73.0%).

Assessment Outlook

The reporting period indicates continued Russian emphasis on **incremental, settlement-oriented advances**, frequently exploiting transportation corridors and river crossings. Ukrainian counter-actions remain **localized and limited in scale**, primarily focused on tactical stabilization rather than broad counteroffensive maneuver.

Equipment Losses and Attrition

Based on WarSpotting reporting, between **06 and 12 January 2026** Russian forces sustained the confirmed loss of **16 major items of military equipment**, bringing the cumulative documented total to **22,200 units**. This represents a **15.8% decrease** in weekly losses compared to the preceding reporting period and remains significantly below the **52-week average of 108.8 losses per week**. The reduced loss rate suggests either a temporary decrease in operational tempo, improved force protection, or under-reporting due to limited observation conditions.

Within the weekly loss profile, **infantry fighting vehicles (IFVs)** accounted for the most notable increase, rising to **seven units**, representing a **75% week-on-week increase**. In contrast, **radar and electronic warfare systems** recorded **no confirmed losses**, marking a complete week-on-week decrease in this category. Relative to annual baselines, the categories labeled **“Other”**,

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

self-propelled artillery, and **infantry fighting vehicles** showed the highest proportional deviations, while losses of **fixed-wing aircraft**, **medical evacuation vehicles**, and **air defense systems** were absent during the reporting period.

Geolocation data was available for **43.8% of recorded losses**, a notable improvement over the previous week (21.1%), increasing confidence in spatial attribution. Unit-level attribution indicates that the **123rd Separate Guards Motor Rifle Brigade (former 2nd LNR Brigade)** sustained the highest identifiable losses during the period. Spatial clustering of loss reports points to **Volnovakha Raion, Donetsk Oblast**, as the primary hotspot, indicating sustained or intensified combat activity in this sector.

Parallel assessment based on **Oryx visual confirmation data** indicates substantially higher overall attrition levels. Between **06 and 12 January 2026**, Russian forces lost **89 units**, while Ukrainian forces lost **90 units**, bringing cumulative totals to **23,933 Russian** and **11,094 Ukrainian** losses respectively. Both sides experienced **week-on-week increases** in losses, with Russian losses rising by **0.4%** and Ukrainian losses by **0.8%**. The resulting **RU/UA loss ratio of 2.16** remains effectively unchanged from the previous week, indicating a stable relative attrition balance.

From a longitudinal perspective, both sides operated **above their respective 52-week averages**, with Russian weekly losses significantly exceeding the long-term mean of **11.1 units** and Ukrainian losses exceeding their **9.6-unit** average. This indicates elevated tactical intensity despite the comparatively modest territorial changes observed during the same period.

Category-level analysis highlights a **Russian loss profile dominated by vehicles, armored systems, and tanks**, with particularly strong deviations above baseline in **soft-skinned vehicles, general armor, and main battle tanks**, suggesting sustained exposure of maneuver and logistics elements. Losses in **air defense, armored personnel carriers, and infantry mobility vehicles** remained below historical norms. Ukrainian losses, by contrast, were heavily concentrated in **infantry casualties, infantry mobility vehicles, and armored personnel carriers**, pointing to intense close-contact engagements and attrition in forward defensive positions.

Overall, the combined WarSpotting and Oryx datasets indicate a week characterized by **continued high-intensity attritional warfare**, with Russian forces sustaining disproportionate losses in vehicular and armored assets, while Ukrainian forces absorbed significant personnel and mobility-related losses. The stability of the loss ratio, coupled with below-average Russian equipment losses in WarSpotting but elevated losses in Oryx, underscores persistent methodological differences between sources and highlights the importance of multi-source triangulation in weekly battlefield assessments.

Settlement level

According to DeepStateMap data covering the period **06–12 January 2026**, fighting inside the urban area of **Pokrovsk (Donetsk Oblast)** remained limited in tempo but tactically significant, reflecting continued close-quarters contestation along a largely stabilized urban frontline.

Pokrovsk has a total area of **31.17 km²**, of which approximately **23.02 km² (73.9%)** was assessed to be under Russian control as of the end of the reporting period. The frontline first entered the settlement on **29 September 2025**, and since that time the battle space has evolved into a predominantly urban and peri-urban engagement zone.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Over the seven-day period, **Russian forces achieved a net gain of approximately 0.38 km²**, while **Ukrainian forces recaptured approximately 0.33 km²**, resulting in a **net territorial change of +0.05 km² in favor of Russian forces**. This balance indicates a near-static frontline characterized by localized advances and counter-actions rather than sustained maneuver.

On **06 January**, Ukrainian forces conducted a limited counter-advance in the **eastern sector of Pokrovsk**, regaining approximately **0.23 km²**. The action secured terrain around a key bridge crossing and extended control along **Olshanskoho Street**, affecting roughly eight adjacent streets. No confirmed Russian territorial changes were recorded on this date.

Between **07 and 11 January**, no confirmed territorial changes were observed for either side, suggesting a temporary operational pause marked by consolidation, positional fighting, or preparation activities rather than active maneuver.

On **12 January**, Russian forces conducted a localized advance in the **western sector of Pokrovsk**, occupying approximately **0.38 km²**. The advance affected **industrial areas and adjacent forested terrain** and secured sections along **Ivana Mazepy Street**, impacting approximately three streets and indicating an effort to improve control over key urban access routes. On the same day, Ukrainian forces executed a limited counter-action in the same general area, regaining approximately **0.11 km²**, primarily across **forested terrain and allotments**, and re-securing portions of one street.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Overall, the reporting period indicates **continued high friction but low momentum** within Pokrovsk. Territorial changes were incremental, highly localized, and focused on tactically relevant urban infrastructure, underscoring the settlement's ongoing role as a contested urban strongpoint rather than a sector of rapid operational exploitation.

Conclusion

In conclusion, the reporting period from **06 to 12 January 2026** confirms the persistence of a **favorable but incremental operational trajectory for Russian forces**, characterized by localized advances, sustained pressure along key axes, and the absence of decisive maneuver breakthroughs. Territorial change remained **asymmetric**, with Russian forces consolidating modest but cumulative gains, while Ukrainian forces achieved only limited, spatially constrained counter-actions insufficient to alter the broader operational balance.

Donetsk Oblast continues to function as the **center of gravity** of ground operations, absorbing the majority of Russian offensive activity and territorial expansion. Russian advances in this sector demonstrate a consistent pattern of **probing, consolidation, and exploitation of tactical opportunities**, gradually compressing Ukrainian defensive depth and increasing pressure on adjacent settlements. Progress in Zaporizhia and Sumy Oblasts, while more limited, reinforces the assessment that Russian forces retain the capacity to apply multi-axis pressure without committing to high-risk, large-scale offensives.

At the tactical level, repeated contact within multiple settlements and the nature of terrain affected—farmland interspersed with forested and residential areas—indicate an operational environment defined by **attritional urban-peripheral fighting**, rather than maneuver warfare. The ability of Ukrainian forces to conduct localized counter-attacks demonstrates continued tactical competence and defensive cohesion; however, these actions remain **reactive and non-decisive**, failing to generate sustained territorial recovery or disrupt Russian operational momentum.

Materiel loss patterns further support this assessment. Russian equipment losses remained **below historical averages**, suggesting controlled employment of forces and the avoidance of costly armored assaults. Loss distributions indicate ongoing reliance on infantry and mechanized formations to secure incremental gains. Ukrainian losses, marginally higher during the period, underscore the asymmetric cost burden associated with defending contested terrain under sustained pressure.

Taken together, current indicators point toward a **protracted phase of the conflict**, defined by steady Russian territorial accretion, limited Ukrainian capacity for operational-level counteroffensives, and persistent high-intensity engagement in eastern and southeastern Ukraine. Absent a significant shift in force generation, external support, or operational doctrine, the near-term outlook suggests continued gradual Russian expansion rather than rapid territorial collapse or decisive breakthrough by either side.

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Equipment Losses Weekly Comparison (WarSpotting)

1. EXECUTIVE OVERVIEW

During the reporting period, Russian forces maintained operational initiative across multiple axes, achieving **incremental territorial expansion** while sustaining **moderate materiel losses**. Ukrainian forces demonstrated localized tactical resilience, particularly within contested urban environments, but were unable to generate sustained operational-level reversals. The overall trajectory remains characterized by **gradual Russian territorial accretion**, **asymmetric loss ratios**, and **persistent pressure on key settlements**, most notably in Donetsk Oblast.

RUSSIAN EQUIPMENT LOSSES (WarSpotting)

2.1 Summary Assessment

Between 06 and 12 January 2026, WarSpotting recorded **16 Russian equipment losses**, representing a **15.8% decrease** compared to the previous week. Losses remained **well below the long-term weekly average**, suggesting controlled force employment and the absence of high-intensity armored assaults. The concentration of losses in infantry fighting vehicles indicates continued reliance on mechanized infantry operations.

2.2 Equipment Losses by Category (RU)

Equipment Category	Losses	WoW Change	% Change
Infantry Fighting Vehicles	7	+3	+75.0%
Transport Vehicles	3	-1	-25.0%
Tanks	2	-1	-33.3%
Drones	1	-1	-50.0%
Self-Propelled Artillery	1	+1	+0.0%
Other	2	-1	-33.3%
Infantry Mobility Vehicles	0	-1	-100.0%
Radars / Jammers	0	-2	-100.0%
Total	16	-3	-15.8%

2.3 Geolocation and Unit Attribution

Indicator	Current Week	Previous Week
Geolocated losses	7 (43.8%)	4 (21.1%)

Most affected units:

- 123rd Separate Guards Motor Rifle Brigade (ex-2nd Brigade LNR)
- 59th Guards Tank Regiment

Primary loss locations:

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

- Volnovakha Raion, Donetsk Oblast
- Oleksandro-Shulytne, Kramatorsk Raion
- Kupiansk Raion, Kharkiv Oblast

Assessment: Loss distribution indicates sustained combat activity in Donetsk Oblast, consistent with observed territorial advances.

BILATERAL EQUIPMENT LOSSES (Oryx)

3.1 Comparative Loss Summary

Actor	Weekly Losses	Cumulative Total	Weekly Change
Russia	89	23,933	+0.4%
Ukraine	90	11,094	+0.8%

RU/UA cumulative loss ratio: 2.16 (previous week: 2.17)

Assessment: Weekly losses for both sides exceeded their respective annual averages, indicating elevated operational tempo.

3.2 Key Equipment Trends (Selected)

Russia – Highest Relative Increases

- Vehicles (+344%)
- Armor (+162%)
- Tanks (+180%)

Russia – Largest Decreases

- Anti-aircraft systems (-100%)
- Infantry mobility vehicles (-100%)
- APCs (-100%)

Ukraine – Highest Relative Increases

- Infantry (+84%)
- Infantry mobility vehicles (+56%)
- APCs (+117%)

Ukraine – Largest Decreases

- Communications
- Engineering
- Logistics

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

Assessment: Russian losses emphasize logistical and transport strain, while Ukrainian losses reflect intensive infantry and mobility-heavy defensive operations.

4. TERRITORIAL OCCUPATION DYNAMICS (DeepStateMap)

4.1 National-Level Overview

Between 05 and 12 January 2026, occupied territory in Ukraine increased by **42.62 km²** (+0.01 percentage points).

4.2 Oblasts with Increased Occupation

Oblast	Change (km ²)	Change (%)
Donetsk	+32.99	+0.12%
Zaporizhia	+6.61	+0.02%
Sumy	+2.31	+0.01%

4.3 Oblasts with Significant Occupation Levels

Oblast	Occupied (%)
Luhansk	99.53%
Crimea (AR)	98.96%
Donetsk	77.93%
Zaporizhia	74.84%

Assessment: Donetsk Oblast remains the principal operational focus, with sustained Russian expansion and high settlement-level engagement.

5. SETTLEMENT-LEVEL ASSESSMENT: ПОКРОВСЬК

5.1 Situation Overview

- **Total area:** 31.17 km²
- **Occupied:** 23.02 km² (73.9%)
- **Initial contact:** 29 September 2025

5.2 Weekly Territorial Change

Actor	Net Change (km ²)
Russia	+0.38
Ukraine	+0.33
Net balance	+0.05 (RU)

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

5.3 Daily Changes Inside Settlement

Date	RU Gain (km²)	UA Gain (km²)	Occupied (%)
2026-01-06	0.000	0.225	73.0
2026-01-07	0.000	0.000	73.0
2026-01-08	0.000	0.000	73.0
2026-01-09	0.000	0.000	73.0
2026-01-10	0.000	0.000	73.0
2026-01-11	0.000	0.000	73.0
2026-01-12	0.383	0.109	73.9

Assessment: Покровськ remains **highly contested**, with limited but persistent positional fighting. Russian advances focused on industrial and transport corridors, while Ukrainian counter-actions remain localized and insufficient to reverse the broader trend.

6. OVERALL ASSESSMENT

The reporting period reflects **continued Russian operational pressure**, supported by manageable materiel losses and incremental territorial gains, particularly in Donetsk Oblast. Ukrainian forces continue to demonstrate **localized tactical effectiveness**, especially in urban environments, but lack the capacity to generate sustained operational-level counteroffensives. Current indicators suggest a **protracted phase of attritional warfare**, with gradual Russian expansion, elevated loss rates, and persistent engagement across key eastern and southeastern axes.

METHODOLOGY

Module 1: Equipment Losses Weekly Comparison (WarSpotting) relies on open-source intelligence from the WarSpotting database, which aggregates visually confirmed Russian equipment losses reported during the conflict in Ukraine. The module uses an automated pipeline to download the most recent dataset from a controlled Kaggle repository if it is not already present locally. After ingestion, the data is cleaned by parsing the date field, removing invalid entries, and retaining key attributes such as equipment type, unit affiliation, nearest location, and geocoordinates where available. The analytical approach is based on a comparative weekly framework: the last seven-day period ending on the most recent entry is contrasted with the preceding week. For both timeframes, the module calculates total losses, the distribution of equipment types, the proportion of geolocated cases, and the most frequently affected units and locations. It then determines absolute and percentage changes in losses across weeks, identifying the largest increases or decreases by equipment category. Outputs are generated in two forms: a structured statistical summary presenting detailed counts and trends, and a natural-language narrative that highlights key findings in descriptive form.

Module 2: Equipment Losses Weekly Comparison (Oryx) performs a similar comparative analysis of equipment losses but uses the Oryx dataset, which is based on visually verified equipment losses for both Russian and Ukrainian forces. The data is sourced from an automated Kaggle repository and is structured as daily cumulative counts across multiple equipment categories for each side. After loading, dates are standardized and all numerical fields are converted to consistent numeric formats to ensure accuracy in time-series calculations. The analysis computes weekly increments by subtracting cumulative totals from the previous week, producing absolute and percentage changes for Russia and Ukraine separately. It also calculates the ratio of Russian to Ukrainian losses and compares these to the prior week to assess relative attrition trends. Beyond weekly differences, the module incorporates a retrospective component, analyzing up to one year of historical data to contextualize the current week's figures against long-term averages and identifying the most significant weekly spikes. The analysis extends to category-level dynamics, evaluating which equipment types recorded the highest increases or decreases relative to their historical averages, thereby identifying emerging tactical or operational trends. The results are formatted as two outputs: a structured statistical summary and a natural-language narrative enriched with retrospective context and category-level interpretation.

Module 3: Occupation Change Analysis (DeepStateMap) evaluates territorial control dynamics by comparing geospatial frontline data from DeepStateMap across a one-week interval. The module combines daily polygons of occupied areas with official oblast-level administrative boundaries, both projected into an equal-area coordinate system to enable precise areal calculations. Occupied and total oblast areas are computed through geometric intersections, producing the absolute extent of occupied territory in square kilometers as well as the percentage of each oblast under control. The analysis first establishes national-level occupation figures for the latest date and contrasts them with values from seven days earlier, calculating absolute and percentage changes to capture weekly territorial shifts. It then disaggregates results at the oblast level, ranking regions by occupation percentage and highlighting the three with the largest increases and decreases in occupied area. A significance filter is applied to identify oblasts with more than ten percent of their territory under occupation, providing a concise set of regions for targeted monitoring. The narrative consists of a short executive-style summary describing national-level occupation and change, and a more detailed report listing oblast-level increases, decreases, and significant cases.

Module 4: Settlements (DeepStateMap) extends the frontline analysis by linking geospatial control changes to populated places, providing a settlement-level perspective on the war's dynamics. The module integrates daily occupied-area polygons from DeepStateMap with point data of Ukrainian settlements (cities, towns, villages) and oblast boundaries derived from official administrative datasets. Geometries are reprojected into a metric coordinate system to ensure accurate distance and area measurements. Weekly gains and losses are computed by differencing occupied-area unions from the most recent seven-day period with those from the preceding week, yielding net Russian gains and Ukrainian recaptures in square kilometers. These figures are contextualized against the previous two weeks to calculate percentage changes in control dynamics. Newly occupied and newly liberated settlements are identified through geometric intersections of the frontline change polygons with settlement points, while oblast-level aggregation highlights the regions experiencing the most pronounced shifts in control. The analysis further estimates the average advance and retreat distances of frontline segments and applies dynamic buffers to detect settlements most at risk of being directly affected in the near term. The outputs consist of a narrative summary describing weekly territorial dynamics, settlement gains and losses, and oblast-level hotspots, supplemented by a forward-looking report listing threatened settlements based on proximity to recent frontline movement.

Module 5: Occupation Projections (DeepStateMap) extends the static occupation analysis by introducing forward-looking estimates of territorial control. The module begins with daily DeepStateMap frontline polygons reprojected into an equal-area system and intersects them with oblast-level administrative boundaries. Occupied area and percentage are calculated for both the most recent and the preceding week, producing absolute and relative changes. These figures form the basis of simple linear projections: if an oblast's occupied area has increased, the weekly increment is extrapolated to estimate the time required for full occupation, expressed in both weeks and years. Conversely, where no gains are observed, occupation is assessed as stalled and no projection is generated. The results are organized hierarchically, beginning with national-level occupation dynamics and continuing with oblast-level projections for regions with partial occupation—defined as between two and ninety-five percent. This filtering ensures that analytical attention is focused on contested territories rather than those almost fully occupied or almost entirely liberated. Outputs consist of structured CSV tables with current, past, and projected values, accompanied by a narrative report. The narrative provides an OSINT-style briefing summarizing overall occupation trends, highlighting oblasts with significant changes, and discussing likely trajectories under current conditions. While the projections offer intuitive insights into possible future scenarios, they remain conditional, assuming the continuation of short-term trends. As with all extrapolations, the results are sensitive to fluctuations in operational tempo, sudden offensives, or withdrawals, and should therefore be treated as indicative rather than predictive.

Module 6: Maps (DeepStateMap) provides a visual representation of frontline developments by converting territorial change into geospatial figures. The module processes daily occupied-area polygons from DeepStateMap, reprojects them into a metric coordinate system, and calculates differences between consecutive days over the past week. Gains and losses are expressed as new geometries, each with associated area in square kilometers. The largest three gains and losses for each day are extracted and visualized on static maps, using red polygons for Russian advances and blue polygons for Ukrainian recaptures, overlaid on an OpenStreetMap basemap for geographic context. Each map includes an inset annotation of the areal extent of the change, while a centered title reports daily totals of territorial gains and losses. These daily map panels are structured as a chronological sequence of figures with headings summarizing the balance of territorial shifts for each day. The report provides both a high-level overview of weekly dynamics and a fine-grained spatial account of where control has changed. By integrating geospatial analysis with cartographic outputs, the module transforms numerical calculations of gains and losses into immediately interpretable visual evidence, ensuring that territorial trends are communicated in an accessible form. Limitations include the resolution of input polygons, which may generalize frontline positions, and the focus on the top three changes per side, which may omit smaller but operationally relevant shifts.

Module 7: Graphs and Pie Charts (DeepStateMap) complements the cartographic outputs with a quantitative visualization of territorial changes over the past week. The module calculates daily gains and losses by comparing consecutive occupied-area polygons, intersecting the resulting geometries with administrative oblast boundaries to attribute changes to specific regions. The outputs are aggregated into a structured dataset capturing Russian and Ukrainian area changes in square kilometers, disaggregated by date and oblast. This information is then transformed into a stacked bar chart showing the scale and composition of daily advances and retreats, with separate columns for Russian occupation and Ukrainian liberation. Distinctive colors assigned to each oblast allow for quick identification of where changes occurred, while patterned hatching differentiates Ukrainian gains from Russian gains. Complementing the time-series perspective, proportional pie charts summarize the distribution of total gains by oblast for each side, scaled in size according to overall magnitude. This dual visualization highlights both temporal dynamics and spatial concentration of activity, making it clear which regions contributed most to shifts in control. The module also generates a statistical summary of the week's developments, including total gains for each side, the three most affected oblasts, and the dates on which peak advances occurred. Limitations stem from the resolution of frontline data and the aggregation of small-scale fluctuations, which may mask micro-level tactical shifts while still capturing operational-level trends.

Module 8: Weekly Territorial Map (DeepStateMap) builds a weekly territorial overview by comparing occupied frontline geometries from the DeepStateMap dataset. The method first identifies the seven most recent days of data and establishes a baseline by selecting the last available date before this weekly window. For longer-term context, a secondary baseline is also taken from one year earlier. By applying geometric operations, the method calculates both newly occupied territories (Russian gains) and liberated areas (Ukrainian gains) over the past seven days. These areas are measured in square kilometers and ranked, allowing the identification of the three largest changes on each side. The visualization combines two layers of analysis: side panels zoom into the three most significant gains for Russia and Ukraine, while the central map shows the full Ukrainian theater. This central view highlights one-year-old occupation zones in gray, overlays recent gains in red and blue, and uses directional arrows to link the side maps with their precise locations. To ensure interpretability, all geometries are reprojected into equal-area coordinates for

FRONT_BOT (Frontline Reporting & OSINT Node Tracker Bot)

Developed by Zsolt Lazar – OSINT Homelab

accurate measurement, and then into web-mercator projection for basemap rendering. The resulting figure situates short-term developments within the broader strategic picture, showing both the absolute scale of weekly gains and their spatial distribution across the front. A concise summary quantifies total Russian and Ukrainian gains, while the side panels and arrows guide the reader to the most dynamic hotspots of the week.

Module 9: TOP3 Territorial Maps (DeepStateMap) expands the territorial change analysis by focusing on the three largest weekly gains for each side and enriching them with predictive and contextual layers. After isolating the top three polygons of change, the method generates a three-by-three grid of maps: the first column displays current occupation zones overlaid on OpenStreetMap basemaps, the second column projects possible near-future contested areas by buffering the current gains and intersecting them with opposing control, and the third column adds a terrain perspective by draping these areas over a reprojected NASA digital elevation model. To enhance interpretability, each map includes dynamic scale bars, highlighted settlement markers, and frames that visually emphasize the change area. A narrative generator complements the maps by describing the absolute and relative scale of each gain, its share of the weekly total, and the settlements currently or potentially affected if the advance continues. This produces not only cartographic but also textual intelligence, making the output suitable for briefing contexts where both visual and written situational awareness are required.
